

Get it. Check it. Install it.

Windows 10/11, 64-bit. No administrator access, PowerShell, coding tools or GitHub account needed.

Development preview. There is no public download or approved release yet. Use only a preview setup file the study organizer gave you directly. If a download, check or step is unavailable or fails, stop and contact the organizer.

1. Get the setup file from the organizer, for example **NoseCalibration-Setup-0.1.0-preview-win-x64.exe**. No ZIP extraction is needed.

2. Check it before running it. Its SHA-256 must match the value the organizer published through a **separate channel**, such as the study announcement. If it differs or you cannot check it, do not run it; contact the organizer.

Any SHA-256 tool works; PowerShell's `Get-FileHash` is one built-in option. A .sha256 file next to the download only detects damage, not who built it.

3. Install. Double-click the setup file and follow the wizard to **Finish**. It installs for your Windows account only. If Setup says Nose Calibration is running, close the app first. Setup does not open the app or start recording.

Unsigned preview. Windows may show a security warning. If you are unsure, stop and contact the organizer. Never disable security software or change security settings to get past a warning.

4. Open Nose Calibration from the Start menu. Read the notice, check consent, then choose **Start session**. Recording stays off until then.

Choose **Solve** to open a question. The top bar always shows **Stop recording**.

Take the practice test.

Work naturally. For human calibration, your interaction patterns matter more than your score.

5. Answer the questions. There are multiple-choice, fill-in-the-blank and dropdown questions, plus two JavaScript coding tasks. Read, scroll, type and correct your answers as you normally would.

6. Try your code. Use **Run Code** to see results. **Save & Proceed** moves on; switching questions keeps answers. You can leave a question unanswered.

The screenshot shows the 'Number summary' question in the Nose Calibration app. The interface is dark-themed. On the left, a sidebar shows a list of questions (S1, S2, 4, 5) with question 4 selected. The main area displays the question text: 'Write a JavaScript function summarize(numbers). Return an object with four properties: count, sum, evenCount, and max. Use a loop to examine the input. For an empty array, return count 0, sum 0, evenCount 0, and max null. Do not modify the input array. This is an easy problem; take your time to format the code clearly.' Below the text are bullet points detailing requirements: input is an array of integers (including negatives and zero), count is the number of elements, sum is the total of all numbers, evenCount is the count of numbers divisible by two (including zero), max is the largest number or null for an empty array, create local variables and loop through the array, no network requests or file access are allowed, and run tests before submitting. A code editor on the right shows a JavaScript function template:

```
function summarize(numbers) {
  // Build your result here.
}
```

 Below the editor is a 'Test Results' section showing 'All test cases failed'. A list of test cases (1-5) is on the left, and a 'Compiler Message' on the right says 'Wrong Answer'. Below that, the 'Input (stdin)' is shown as an empty array `[]`, and the 'Expected Output' is `{ "count": 0, "sum": 0, "evenCount": 0, "max": null }`. At the top right, there is a 'Save & Proceed' button. At the bottom right, there is a 'Run Code' button.

7. Finish or stop. Choose **Submit Test** to grade answers and stop recording, or **Stop recording** at any time. Closing the app also stops it.

What is recorded? Only the focused practice interface: pointer movement and clicks, key presses, scrolling, selections, your answers and throttled screenshots taken on clicks. Nothing before Start or after Stop. Do not type passwords or personal information into answers.

Local by default. Recordings stay on this computer unless you share them. **Earlier recordings** on the start screen reopens a saved session without restarting recording. **Export session file** creates a readable private ZIP: share it deliberately. Uninstalling the app from **Settings > Apps** removes the program, not your recordings.

Share with an invitation code.

Optional, for each finished recording. No GitHub account is needed.

Not enabled yet. Live invitation upload is not yet enabled or verified. These steps describe the flow once the organizer enables it; the organizer will tell you if and when to use it. Use only a code the organizer gave you. If Connect or sharing is unavailable or fails, contact the organizer.

1. Connect. On Results, paste your code and choose **Connect**. Keep it private. A code works for at most 7 days and up to 3 recordings. The connection stays in app memory only; **Disconnect** or closing the app clears it. **Connecting uploads nothing and is not consent.**

1 Connect your invitation
Paste the code from your invitation. Use only a code the study organizer gave you. The field clears as soon as you press Connect.

INVITATION CODE

Connected. Disconnect to use a different code.

☒ **Connected with your invitation**

2. Consent, then Encrypt and share. Read the notice, check the separate consent box and choose **Encrypt and share**. The recording is encrypted on this computer with the organizer's public key; the organizer decrypts it on their own computer.

2 Consent, then encrypt and share
Connecting is not consent to share. Numeric metrics derived from your session may be reviewed by OpenAI Codex. Raw code, key presses and screenshots are not automatically sent to any AI model.

☒ I consent to encrypt this recording on this computer and upload it to the study service, where the study organizer can download and decrypt it.

Shares only this recording.

Stored means the study service holds an encrypted copy. **Received by organizer** means the organizer downloaded it: it confirms delivery only, not that the recording was checked or validated.

If sharing fails, an encrypted copy may still have reached the service; do not treat it as received. Contact the organizer and retry the same recording from **Earlier recordings** only when they advise.

Only completed human recordings can be shared; stopped, timed-out, test and Codex runs cannot, and the app makes the final check. Numeric aggregate metrics may receive optional Codex advisory review. Raw code, key presses and screenshots are not automatically sent to an AI model. No setup can guarantee zero risk or anonymity.

Appendix: earlier GitHub sharing.

Optional. Use only for earlier recordings, or if the organizer asks you to use GitHub.

Invitation sharing does not need GitHub. If asked to use GitHub, open **Earlier GitHub sharing** under Results. Its buttons open GitHub pages; the app creates, installs and invites nothing itself.

Set up once

1. In your personal account, create **nose-calibration-submissions** and choose **Private**.
2. Install the **Nose Calibration** GitHub App. Choose **Only select repositories** and select only that repository; never All repositories. It requests **Contents: read and write** and **Metadata: read-only**.
3. In that repository, open **Settings > Collaborators** and invite **Dhruvsa1** once; the organizer must accept. Add no other collaborators: they block sharing.

Each recording

Sign in to GitHub and enter only the code your collector shows at **github.com/login/device**; never a code someone sends you. Check the account shown. Signing in uploads nothing. Then check the separate consent box and choose **Encrypt and share**.

Stored is not a final receipt while organizer access is pending. Wait for the organizer to accept, then share again to verify.

Access and sign-out

The organizer keeps **standing write access** to that repository: they can decrypt shared recordings and read, change or delete its files, including future shares, until you remove them.

The sign-in token stays in app memory for at most eight hours and is never saved. **Sign out** or closing the app clears it locally but does not revoke it: revoke under GitHub **Settings > Applications > Authorized GitHub Apps**, and manage repository access under **Installed GitHub Apps**. Remove Dhruvsa1 separately. None of this erases copies already received.

Need help?

Contact the organizer if any step is unavailable or fails. Never post invitation codes, sign-in codes or recordings publicly. Live invitation upload, live GitHub upload and clean-machine installation are not yet verified in this preview.
